

Wirebury Connections Inc. INTERROGATORY #11

Interrogatory

Networks speculates that broad application of service area amendments would allow distributors to acquire customers without compensating the incumbent distributor and that local efficiencies accruing to the applicant's customers may cause costs to increase for all customers in the distribution sector.

Reference: p.11, L2-14

- a) In the case of existing customers, if the incumbent is reimbursed fairly for any customer specific assets, what other recovery would be required and why would this be necessary to keep rates from increasing across the sector?
- b) In the case of new customers connecting through embedded distribution, why would the incumbent need to be compensated?
- c) If competition is limited to embedded distribution and new customers who are required to pay the operating and fixed costs associated with the embedded connection, why would rates increase for other customers?
- d) If the competition for new customers as described in (c) leads to lower prices, newer technology or better value for the attaching customers without adversely impacting other customers, please identify any efficiency or public interest reason that would justify prohibiting customer choice and open competition for new customers in unserved areas?
- e) Why does Networks feel that it is not in a position to compete for new customers in order to spread its fixed costs across a broader customer base thereby lowering the average cost of service to its customers?

Response

- a) Please see Networks' Exhibits J8-11-1, J8-12-04(a)(b) and J8-12-11(b). Recovery would be required for the portion of upstream assets – the assets beyond the “customers specific assets” cited by Wirebury – left underutilized by the loss of the existing customers.
- b) See Networks' Exhibits J8-12-44 and J8-12-45. In addition, Networks' overheads, including customers systems and information technology systems, have been

1 planned to accommodate new customer growth over the life of the assets. If new
2 customers are “cream skimmed” through new embedded distributors, Networks
3 loses an opportunity to spread its fixed costs over a larger customer base. Indeed,
4 without any new growth, Networks has a declining customer base and would face
5 higher unit costs for overheads. Please see Networks' Exhibit J8-12-5.

6
7 c) See Networks' Exhibit J8-10-7 and J8-10-8(c). The loss of customers has an
8 opportunity cost. While some parties to this hearing would suggest that the loss of
9 new customers would not affect rates, if the principle of competition for new
10 customers is established, Networks has the potential to have a declining customer
11 population. This is because of the large volume of service cancellations Networks
12 experiences from rural depopulation and other factors. The increase in cost would
13 put upward pressure on rates.

14
15 d) See Networks' Exhibit J8-12-1(e). Networks does not accept the premise of this
16 portion of the interrogatory with respect to “lower prices”, “without adversely
17 affecting other customers”, and “unserved areas”. Any prospect of lower prices
18 is based on short-term advantages for the attaching customer that is derived from
19 the transitional nature of rates. Moreover, this motivation does not result in
20 greater overall efficiency, it does not come without harm to the existing
21 customers, and thus is not in the overall public interest. Wirebury has not
22 explained how Networks or other LDCs would not be in a position to offer the
23 same technology.

24
25 e) Please see Networks' Exhibit J8-10-8(d). There are three issues. First,
26 competition has not been established, and as in any orderly transition from
27 monopoly to competition market rules would need to be established. Second, in
28 most instances, growth is outward from urban LDCs, not inward to urban areas
29 from rural areas. Given the character of its service territory, much of the
30 competition will be within Networks' existing licence area, as is evident in 8 of
31 the 9 applications in this hearing. Third, Networks' transitional rates are based on
32 the legacy rates of the former Ontario Hydro. In the former public utility
33 environment, the former Ontario Hydro had a public utility objective as a residual
34 supplier where there were not any municipal or private distribution utilities, and
35 thus has low customer density and higher unit operating costs. In addition,
36 Networks' rates are “postage stamp” in character, such that while the rates are
37 based on common density criteria there are different operating costs across
38 different regions of the province depending on the character of the service
39 territory, e.g., farmlands and the Canadian Shield.
